Publication Title:

Method and apparatus for providing a seamless tiled display

Abstract:

Abstract of EP1271944

A display for producing a seamless composite image from at least two discrete images, comprises a screen; projection means for projecting each of the discrete images separately onto the screen, said projection means projecting the discrete images such that at least one of the discrete images overlaps at least one adjacent discrete image thereby forming at least one overlap region; and blending means coupled to said projection means for blending a selected characteristic of at least one of the discrete images in the at least one overlap region, characterised in that at least one of the discrete images overlaps at least one adjacent discrete image by more than 25 percent of that adjacent discrete image.
